二叉搜索树

AVL树:渐近平衡

邓後辑 deng@tsinghua.edu.cn

平衡因子

- **\$\Delta Balance Factor:** $balFac(v) = height(\mathbf{lc}(v)) height(\mathbf{rc}(v))$
- \clubsuit G. Adelson-Velsky & E. Landis (1962): $\forall v \in AVL, \ |balFac(v)| \leq 1$

❖ AVL树未必理想平衡,但必然渐近平衡...

AVL = 渐近平衡

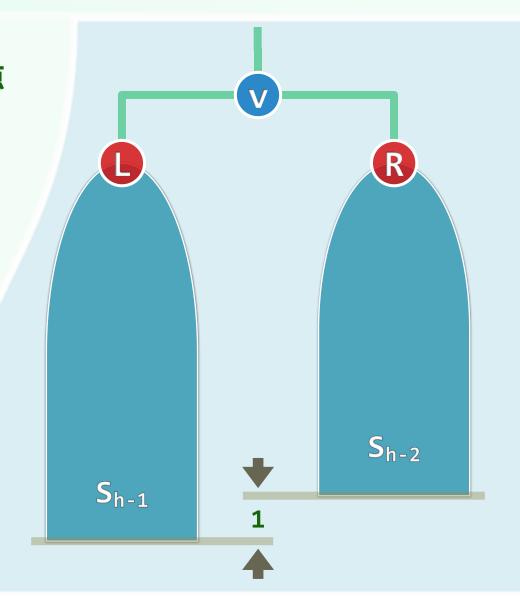

- ❖ 高度为h的AVL树,至少包含S(h) = fib(h+3) 1 个节点为什么?
- ❖ 固定高度h , 考查节点最少的AVL树 . . .
- * 将其规模记作 S(h)

$$S(h) = 1 + S(h-1) + S(h-2)$$

$$S(h) + 1 = [S(h-1) + 1] + [S(h-2) + 1]$$

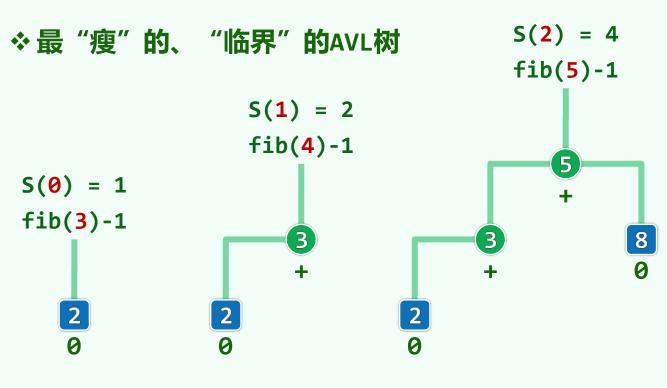

$$fib(h+3) = fib(h+2) + fib(h+1)$$

❖ 反过来,由n个节点构成的AVL树,高度不超过 $\mathcal{O}(\log n)$

Fibonaccian Tree

❖ 高度为h , 规模恰为 S(h) = fib(h+3) - 1 的AVL树

 $1, 2, 4, 7, 12, 20, 33, 54, 88, 143, \dots$

 $0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, \dots$
